Question What is the primary difference between bacteria and viruses? Bacteria are single-celled organisms that can live and reproduce independently, while viruses are non-living particles that require a host cell to reproduce. What does the term 'pathogen' refer to in the bacteria and viruses chapter? A pathogen is a microorganism, such as bacteria or viruses, that causes disease in its host. What is the function of antibiotics, and do they work on viruses? Antibiotics are medicines that kill or inhibit the growth of bacteria; they do not work on viruses because viruses lack the cellular structures targeted by antibiotics. Define 'vector' in the context of disease transmission. A vector is an organism, such as a mosquito, that transmits a pathogen from one host to another. What are some common ways bacteria and viruses can be transmitted? They can be transmitted through direct contact, contaminated food or water, airborne droplets, vectors like insects, or contact with contaminated surfaces. What does 'antigen' mean in relation to viruses? An antigen is a molecule on the surface of a virus that triggers an immune response in the host organism. Why is vaccination important in controlling bacterial and viral diseases? Vaccination helps the immune system recognize and fight specific pathogens, preventing illness and controlling the spread of diseases caused by bacteria and viruses.
